EXAMINER'S AMENDMENT

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.

The application has been amended as follows:

In the Specification, page 1, following the Title, please enter:

--This application is a 371 of PCT/GB03/02723, filed 06/25/2003 which claims priority of United Kingdom Patent document 0214645.4, filed 06/25/2002--

In the Specification, page 4, line 24, please delete the word "and"

In the Specification, page 4, line 28, please delete the words ", one of which is shown in Figure 16." and insert the words --; and-- therefor.

In the Specification, page 4, before line 30, please insert the paragraph:

--Figure 16 is a plan view of a sheet cut from the substrate of Figure 15.--

Authorization for this examiner's amendment was given in a telephone interview with Richard Tushin on 1/12/2007.

Response to Arguments

Applicant's arguments filed 11/1/2006, with respect to the rejections under 35 U.S.C. 103(a) and 35 U.S.C. 112 have been fully considered and are persuasive. The rejections have been withdrawn.

Oath/Declaration

The oath or declaration is defective. A new oath or declaration in compliance with 37 CFR 1.67(a) identifying this application by application number and filing date is required. See MPEP §§ 602.01 and 602.02.

The oath or declaration is defective because:

It does not identify the foreign application for patent or inventor's certificate on which priority is claimed pursuant to 37 CFR 1.55, and any foreign application having a filing date before that of the application on which priority is claimed, by specifying the application number, country, day, month and year of its filing.

Reasons for Allowance

The following is an examiner's statement of reasons for allowance. The nearest prior art, Murakami et al (EP1114893 A1), teaches a security paper having an embedded elongate element visible through windows formed in one side of the paper that are greater in width than the elongate element. The windows are formed by rubbing fibers off of some portions of the embedded element. Murakami et al does not disclose or suggest windows that penetrate completely through the paper. Tooth et al reveals an embodiment of a process of making a security paper wherein an elongate element can be at least partially seen through windows in both sides of the paper, but fails to disclose that an edge of the elongate element is exposed. The windows are formed by blocking deposition of the fibers during formation of the paper. The prior art in general teaches embedding the edges of the elongate strips so as to secure them in the paper, providing no suggestion or motivation to make a paper having windows extending completely through the paper and exposing an edge of the embedded element.
